Project Title: Library Management System

Synopsis of Project: This project is a console-based Library Management System developed using the C++ programming language. The system helps maintain and manage book records in a library. It allows the user to:

- Add new books
- Display all books
- Search for a book by ID
- Issue a book
- Return a book
- Delete a book record

All the records are stored using binary file handling, which ensures fast processing and secure data storage.

A class named Book is used to store important book details such as book ID, book name, author name, and quantity.

It is useful for small libraries or institutions to maintain book inventory efficiently and reduce manual effort.

Future work (Scope of work): Can be upgraded to a GUI-based application

Student registration and login system can be added

Can be connected to a database (MySQL / SQL Server)

Can be developed into a full online library portal
